Database integration

Adding the capability to connect databases to Express apps is just a matter of loading the database in your app. This document briefly explains how to add and use some modules for database systems in your Express app:

- [Cassandra](#)
- [Couchbase](#)
- [CouchDB](#)
- [LevelDB](#)
- [MySQL](#)
- [MongoDB](#)
- [Neo4j](#)
- [Oracle](#)
- [PostgreSQL](#)
- [Redis](#)

[Routing](#)[Writing middleware](#)[Using middleware](#)[Using template engines](#)[Error handling](#)[Debugging](#)[Express behind proxies](#)[Moving to Express 4](#)[Moving to Express 5](#)[Database integration](#)

MongoDB

Module: [mongodb](#)

Installation

```
$ npm install mongodb
```

Example

```
var MongoClient = require('mongodb').MongoClient

MongoClient.connect('mongodb://localhost:27017/animals', function (err, db) {
  if (err) throw err

  db.collection('mammals').find().toArray(function (err, result) {
    if (err) throw err

    console.log(result)
  })
})
```

```
$ npm install mongodb
```

Example

```
var MongoClient = require('mongodb').MongoClient

MongoClient.connect('mongodb://localhost:27017/animals', function (err, db) {
  if (err) throw err

  db.collection('mammals').find().toArray(function (err, result) {
    if (err) throw err

    console.log(result)
  })
})
```

If you want an object model driver for MongoDB, look at [Mongoose](#).
